

Step five? It failed. So, I booted the iMac and gave the four-fingered salute, Command-Option-O-F. Rather than finding myself at an Open Firmware prompt, as expected, I watched the machine boot into Linux again. Open Firmware would not open (more than a touch ironic). After numerous attempts, we detached the ancient keyboard and attached a brand-new one. It worked perfectly.

Step five, failed. I booted the iMac, gave the four-fingered salute Command + Alt + "O" + "F", and rather than finding myself at an Open Firmware Boot Prompt, as expected, watched the machine boot into Linux. Open Firmware would not open (more than a touch ironic). After numerous attempts, we pulled out the ancient keyboard and put in a brand new one. And it worked perfectly. Step five, check. Two steps from success.
